Electric Charges – Branching Assignment

Python test results for all required test cases.

Test Case 1 — 1500 KW hours → \$122.625

The screenshot displays the Programiz Python Online Compiler interface. The editor on the left contains a Python script named `main.py` that calculates the amount owed based on the number of kilowatt (KW) hours used. The script uses a branching logic: if the usage is 1000 KW hours or less, it calculates a flat rate of \$7.633 per 100 KW hours. If the usage exceeds 1000 KW hours, it calculates a base rate for the first 1000 KW hours and then adds a higher rate of \$9.259 per 100 KW hours for the additional usage.

```
1 kw_hours = int(input("Enter the KW hours used: "))
2
3 if kw_hours <= 1000:
4     amount_owed = kw_hours * 7.633 / 100
5 else:
6     amount_owed = (1000 * 7.633 / 100) + ((kw_hours - 1000) * 9.259 / 100)
7
8 print("Amount owed is $", amount_owed)
```

The output window on the right shows the result of running the script with an input of 1500 KW hours. The output is: "Enter the KW hours used: 1500" followed by "Amount owed is \$ 122.625".

At the bottom of the interface, there is a URL for Google Ads: https://googleads.g.doubleclick.net/dm/click?sa=L&ai=CdVZa_8q1arebFui6pMYP66GRmQpd09y4iAHVL7i9BWga8j6xkgQASClgLUYmMgGIDco9wQoAGI1YP_AsgB8ggQAcgDmwSgBJACT9DDiHLA4H35eIVIE2but4RdRtYvwwL1N6WFTW0ihQ4bZnBLPsZb5smvJv5pDKtTg8joiG_7OzG8R-8OH-g...
